EVTOL Sector Overview

Why Flying Taxis Deserve More Attention Than They're Getting!

The electric vertical takeoff and landing (eVTOL) sector represents one of the most underappreciated opportunities in modern transportation, yet it remains largely off investors' radar. While the market obsesses over the latest AI developments and mega-cap tech earnings, a quiet revolution in urban air mobility is taking shape—one that could fundamentally reshape how we navigate congested cities.

Joby Aviation, Inc. (JOBY) \$10.38 -51.98%

Joby Aviation stands at the forefront of this emerging industry, pursuing an ambitious vertical integration strategy by manufacturing aircraft in-house rather than outsourcing production. This approach, reminiscent of Tesla's early playbook, aims to build sustainable competitive advantages in an industry where regulatory approval processes create natural barriers to entry. Unlike the crowded electric vehicle market, eVTOL manufacturers face fewer competitors and significantly higher moats due to lengthy FAA certification requirements.

Joby Aviation has secured a critical competitive edge by integrating its air taxi service directly into Uber's platform, eliminating the need to build consumer awareness and booking infrastructure from the ground up. Instead of convincing users to adopt a new app, Joby taps into Uber's massive existing customer base, allowing seamless booking of electric air taxi flights alongside traditional rides within a familiar interface.

Founded in 2018 and publicly listed in 2021, Archer has designed its Midnight aircraft for short urban hops of 20-50 miles at speeds reaching 150 mph. The 12-propeller configuration prioritizes low noise levels—critical for urban acceptance—while targeting flight times of 5-15 minutes between city locations.

Archer Aviation, Inc. (ACHR) \$7.50 -51.30%

The company has secured meaningful partnerships with United Airlines as a launch customer and manufacturing support from Stellantis and Boeing. Public flight demonstrations in both the U.S. and UAE have validated the technology, while Archer's acquisition of Hawthorne Airport in Los Angeles provides owned infrastructure for operations. The company aims to launch commercial service by 2026, with expansion plans targeting the 2028 Olympics.

Everything hinges on FAA approval. Archer is progressing through required flight testing milestones and approaching the Type Inspection Authorization phase—the final stretch before full certification. The company is also pursuing alternative pathways including U.S. pilot programs and paid demonstration flights in Abu Dhabi to generate early operational experience and potentially limited revenue before full certification.

If Archer achieves type certification by 2026 as targeted, it unlocks commercial operations and begins converting its order backlog into actual revenue. Delays, however, would extend the cash burn period and push meaningful revenue further into the future.

Eve Holding, Inc. (EVEX) \$3.00 -60.99%

EVE

Eve Air Mobility, backed by aerospace giant Embraer, positions itself as a sustainability-driven eVTOL manufacturer with operations centered in Brazil. The company's manufacturing facilities run entirely on renewable energy sources, reflecting a commitment to environmental responsibility that extends beyond just building electric aircraft. Eve emphasizes a holistic approach to sustainability—incorporating recycled materials, water-based paints, responsible battery disposal programs, and waste reduction initiatives throughout their production processes.

eVTOL Aircraft Market Size

by Propulsion, 2020 - 2030 (USD Billion)

In early February 2026, Eve secured a binding order from Tokyo-based AirX for up to 50 eVTOL aircraft—the company's first deal in the Asia-Pacific region with initial deliveries scheduled for 2029. The partnership aims to establish sustainable air mobility routes in major Japanese cities including Tokyo and Osaka, supporting both tourism and last-mile transportation needs.

[eVTOL Aircraft Market Size, Share & Trends Report, 2030](#)

Additionally, Eve obtained up to \$15 million in guaranteed financing from the Export-Import Bank and Private Export Funding Corporation in mid-January 2026. These funds will support battery system
